

4D-Stage R-Axis Upgrade

The standard O-ring belt drive on your USB 4D-Stage can be upgraded to this new tooth-belt drive. It provides more precise and repeatable motion along with better resolution. The pulley ratio allows the Sample-Tube to be positioned with 0.5 degree increments. This is over three times (3X) better than the O-rings 1.8 degree steps.

We provide this upgrade as a kit (pulleys, belt, and tensioner) to allow you to retrofit your 4D-Stage in the field. Simply remove the O-ring belt and drive pulley and replace them the parts in the kit. See the instruction on the back for more details.
